Tata Consultancy Services

Dear Hiring Team,

I am writing to apply for the Entry-Level AI Developer position with Tata Consultancy Services in Hartford, Connecticut. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out because it combines the areas I am most interested in growing within: Python-based software development, AI application development, data-driven problem solving, and client-focused solutioning.

My background includes full-stack development, Python, TypeScript, REST APIs, SQL/PostgreSQL, data workflows, automation, and AI-assisted engineering. In my project Backlog, I built a full-stack platform that ingests job data from multiple sources, normalizes messy descriptions, tracks application state, and uses OpenAI/Claude integrations to support role-fit scoring and workflow automation. That project gave me hands-on experience thinking about how AI can be integrated into real software systems rather than used only as a standalone chatbot.

I also worked as a Software Engineer Intern at EpiBuild, where I built internal tools around clinical data collection, normalization, and billing-related workflows. That experience taught me how important it is to understand the business context behind the software, especially in healthcare-adjacent environments where accuracy, privacy, and reliability matter. I learned to work with imperfect data, translate operational needs into technical improvements, and build tools that reduce manual work for real users.

What interests me about this AI Developer role is the opportunity to learn from senior AI consultants and architects while contributing to practical AI solutions for client problems. I am especially interested in OpenAI integrations, generative AI workflows, data analysis, prompt and workflow evaluation, responsible AI practices, and the full lifecycle of taking an AI idea from requirements to deployment. I understand that strong AI development is not just about using models; it also requires clean data, thoughtful evaluation, secure integration, maintainable code, and clear communication with stakeholders.

I would be excited to bring my software engineering foundation, Python experience, AI-assisted

development workflow, and willingness to learn to TCS. I am authorized to work in the United States, do not require sponsorship, and am open to relocating for the right opportunity.

Thank you for your time and consideration.

Sincerely,

Kenny Nguyen
