Information Services, University of Oregon

Dear Hiring Committee,

I am excited to apply for the Application Infrastructure Engineer position with Information Services at the University of Oregon. As a Computer Science student graduating March 21, 2026, I bring strong software development, system administration, and infrastructure management experience that aligns well with supporting enterprise application systems at UO.

My experience aligns with the core requirements of this position. I have a solid foundation in systems analysis and programming through my Computer Science degree and hands-on work. In my current role as a Software Engineer Intern at EpiBuild, I have developed and maintained full-stack web applications, implemented system integrations, and created automated workflows. I have experience with database connectivity, data processing, and building systems that integrate multiple components, skills directly applicable to enterprise application infrastructure.

My technical skills match several preferred qualifications. I am proficient with version control using Git and have extensive experience with multiple programming languages including Python, Java, JavaScript, HTML, and SQL through my coursework and projects. I have developed automation scripts and tools, implemented data processing pipelines, and created systems that require configuration management and monitoring. My experience with full-stack development demonstrates understanding of client/server models, web-based technologies, and database integration.

My system administration experience from my role as Computer Helpdesk Technician at Pacific University provided hands-on experience with Windows systems, troubleshooting software and hardware issues, and managing system performance. I have experience configuring systems, performing installations, and ensuring system integrity, all essential for maintaining enterprise application infrastructure.

What makes me particularly well-suited for this role is my experience with system integration and automation. I have developed intelligent data matching systems, created automated workflows, and built applications that process and integrate data from multiple sources. My projects demonstrate my ability to design systems, implement solutions, and ensure data integrity, skills directly applicable to enterprise system management, upgrades, and migrations.

I understand that this position involves supporting enterprise software systems, performing maintenance and upgrades, implementing automation strategies, and ensuring system performance and security. While I am still developing expertise in specific enterprise platforms like .NET and Windows Server administration, I have a strong foundation in software development, system administration, and infrastructure concepts that positions me well to learn and contribute quickly.

I am particularly drawn to this opportunity because it combines software development, system administration, and infrastructure management, areas where I am eager to grow. The chance to work on enterprise systems that support UO's research, teaching, and learning mission represents exactly the kind of impactful work I am passionate about pursuing. I am excited about the opportunity to contribute to Information Services while developing expertise in enterprise application infrastructure.

Thank you for considering my application. I look forward to the possibility of contributing to Information Services and supporting the technology infrastructure that enables excellence at the University of Oregon.

Sincerely,

Kenny Nguyen
