Andrews Cooper Technology LLC

Dear Hiring Team,

I came across the Associate Controls Engineer (Software) role and wanted to reach out because it lines up well with what I've been building toward as a recent computer science grad. I've been focused on software engineering, mainly working with Python, JavaScript, and C++, and I've spent a lot of time building projects where I actually have to think through systems end-to-end (not just writing code, but designing how things interact and stay maintainable and the tradeoffs between different designs). I've been interested in how software connects to real-world systems, which is why this role caught my attention.

In my recent work, I've built full-stack applications, worked with APIs, and used tools like React and modern deployment workflows. I also tend to lean heavily on iteration (using tools like AI assistants such as Claude Code, Codex, and Gemini to prototype faster, then refining things into cleaner, more structured code). That process has helped me get comfortable debugging, creating test suites, and improving systems quickly.

What stood out to me about Andrews Cooper is the hands-on and engineering-focused environment. I like roles where I can learn quickly, contribute early, and work on problems that aren't purely abstract. The controls/software crossover seems like a really strong place to grow technically while building something meaningful.

I'd love the chance to learn more about the team and how I could contribute.

Thanks for your time,

Kenny Nguyen
