Northeast Ohio Medical University

Department of Information Technology

Dear Hiring Team,

I am writing to apply for the Data Engineer position with Northeast Ohio Medical University's Department of Information Technology. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and I am interested in contributing to data systems that support education, healthcare, institutional operations, and better decision-making across a mission-driven academic environment.

What stood out to me about this position is the emphasis on building reliable, governed data flows across academic, administrative, and clinical systems. I'm especially interested in data engineering work where quality, validation, access control, and compliance are not afterthoughts, but part of the technical foundation. NEOMED's focus on secure and reliable data for reporting, analytics, operations, and compliance aligns with the kind of careful, detail-oriented engineering I want to grow into.

My most relevant professional experience comes from my Software Engineer Internship at EpiBuild, where I automated clinical data processing using Google Apps Script and worked with spreadsheet-based healthcare records. I extracted and normalized chart data, then developed patient-matching logic using Levenshtein distance to resolve inconsistent name spellings and missing identifiers. That experience gave me a strong appreciation for data quality in healthcare-adjacent workflows, especially when small inconsistencies can create downstream confusion.

My project work has also involved designing and building data-driven systems end-to-end. In Backlog, I built a full-stack job search platform that ingests job postings from multiple sources, filters noisy data, normalizes job descriptions with AI, scores role fit, and tracks application workflows using a database-backed system. In Syllabify, I helped build an academic planning application that parses unstructured syllabi into structured assignments and generates schedules around user preferences, calendar data, and other constraints. These projects strengthened my experience with Python, SQL, backend APIs, relational databases, data modeling, validation

logic, and turning messy inputs into usable outputs.

I understand that this role requires collaboration with Institutional Research, Registrar, Finance, HR, academic programs, IT security, and compliance teams. I enjoy working across disciplines, asking careful questions, and translating real operational needs into reliable technical solutions. I would be excited to bring my software engineering foundation, healthcare-adjacent data experience, attention to detail, and willingness to learn to NEOMED's IT team.

Thank you for your time and consideration. I would welcome the opportunity to discuss how my background in data workflows, application development, and structured problem solving could support NEOMED's mission.

Thanks for your time,

Kenny Nguyen
