Temple Allen Industries

Dear Hiring Team,

I am writing to apply for the Entry Level Full-Stack Developer (HMI - UI/UX) position at Temple Allen Industries. This role stood out to me because it combines several areas I'm excited about: modern UI development, interactive visual systems, backend integration, and software that connects directly to real physical processes. The idea of building Human–Machine Interfaces for robotics and industrial automation is especially interesting to me because the interface is not just decoration — it directly affects how safely and effectively an operator understands and controls the system.

I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and my background includes full-stack web development, UI-focused projects, backend/API work, mobile development, and production debugging. I've worked with React, TypeScript, JavaScript, Python, databases, Git workflows, and modern deployment tools, and I enjoy building interfaces that are both visually clear and technically maintainable.

In my project work, I've spent a lot of time thinking about how users interact with complex systems. Backlog, my full-stack job search platform, involved building a polished React/TypeScript interface around messy job data, AI role scoring, application workflows, and realtime status tracking. Syllabify, an academic planning application, focused on turning unstructured syllabus and calendar data into a usable scheduling experience for students. In both projects, the hard part was not only making the system work, but making the workflow understandable and easy to act on.

I also have experience that feels relevant to Temple Allen's visual and device-focused work. Klip, my desktop video editor project, uses Electron, React, TypeScript, FFmpeg, and interactive timeline controls to support multi-track editing, waveform visualization, drag interactions, and export workflows. Shuckler, my Android music app, involved Kotlin, Jetpack Compose, media playback, foreground services, lock-screen controls, and user-facing interaction design. While I have not yet worked professionally on robotics HMIs, I'm very interested in developing that skill set and applying my UI, full-stack, and mobile experience to systems where feedback, clarity, and operator trust matter.

What interests me about Temple Allen is the mix of software, hardware, robotics, machine learning, and industrial process improvement. I like working on products where engineering decisions have real-world consequences, and this role seems like a place where careful design, clear communication, documentation, and collaboration with mechanical, electrical, and controls engineers all matter. I'm also drawn to small-company environments where I can learn quickly, take ownership, and contribute across both design and development.

I would be excited to bring my full-stack development background, UI/UX focus, curiosity, and willingness to learn to Temple Allen Industries. Thank you for your time and consideration.

Thanks for your time,

Kenny Nguyen
