Wolverine Trading

Dear Hiring Team,

I am writing to apply for the Entry-Level C++ Software Engineer position at Wolverine Trading. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it offers the opportunity to grow as an engineer at the intersection of software, performance, systems, and financial markets.

My background includes computer science fundamentals, object-oriented programming, data structures and algorithms, software engineering, debugging, testing, and building practical applications. I have experience with C++, C, Python, Java, C#, JavaScript/TypeScript, SQL, Git, and full-stack development. While my strongest project experience so far has been in Python and web application development, I'm especially interested in deepening my C++ experience in a production environment where speed, reliability, and correctness matter.

One project that reflects my interest in lower-level software and code quality is MemLock, a static analysis CLI I built for C code using Python and Tree-sitter. It detects vulnerability patterns such as buffer overflows, use-after-free risks, format string issues, hardcoded secrets, null pointer risks, and unsafe standard library usage. Building it required me to reason about source-code structure, memory safety, parsing, debugging, and how small implementation details can create larger system risks.

I have also built larger application projects that required careful data modeling, debugging, and workflow design. Backlog, my full-stack job search platform, uses Next.js, TypeScript, Supabase/PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel to ingest job postings, normalize data, score role fit, and track application state. Syllabify, my academic planning application, involved backend APIs, database persistence, authentication, calendar integration, and scheduling logic. These projects strengthened my ability to break down ambiguous requirements, build maintainable systems, test behavior, and debug issues across multiple layers.

What interests me about Wolverine is the opportunity to work close to the trading floor and see how engineering decisions directly affect real-time systems. I'm drawn to software where performance, stability, and clear communication matter, and I would value the chance to learn

from senior engineers, traders, and hardware specialists while contributing to C++ applications that support trading platforms.

I'm early in my career, but I bring strong problem-solving fundamentals, curiosity, a willingness to learn quickly, and a genuine interest in high-performance systems. I would be excited to grow at Wolverine Trading and contribute to engineering work where speed, efficiency, and reliability make a measurable difference.

Thank you for your time and consideration.

Sincerely,

Kenny Nguyen
