Tata Consultancy Services

Dear Hiring Team,

I am writing to apply for the Entry-Level Data Engineer position with Tata Consultancy Services. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it offers the opportunity to grow as a data engineer while working with large-scale data platforms, ETL pipelines, cloud infrastructure, and enterprise data workflows.

My background includes software development, SQL, Python, database-backed applications, data cleaning, validation logic, automation, and working with messy real-world data. In my Software Engineer Internship at EpiBuild, I built internal tools to support clinical data collection, extraction, normalization, and billing workflows. I used automation to reduce repetitive manual data entry, improve consistency, and transform raw operational data into cleaner structured formats. I also developed patient-matching logic using Levenshtein distance to identify inconsistent name spellings, duplicate records, and missing identifiers across spreadsheet-based medical data.

That experience is what draws me to data engineering. I enjoy the process of taking data from different sources, cleaning and validating it, designing structures that make it easier to use, and helping teams trust the outputs they rely on. I am comfortable with Python, SQL, relational databases, backend logic, API integrations, and building systems where accuracy and maintainability matter.

My project work has also strengthened my data and pipeline-oriented thinking. In Backlog, I built a full-stack job search platform that ingests job postings from multiple sources, filters noisy data, normalizes job descriptions with AI, scores role fit, and tracks application state through a PostgreSQL-backed system. In Syllabify, I helped build an academic planning application that parses unstructured syllabi into structured assignments and generates schedules around user preferences and calendar data. Both projects required thinking carefully about data models, transformation logic, validation, and how clean data supports useful downstream workflows.

While I have not yet worked professionally with Databricks, Spark, Kafka, or Hadoop, I am very

interested in developing those skills and applying my Python, SQL, data validation, and software engineering foundation to larger-scale data systems. I'm especially interested in learning how enterprise data lakehouses, dimensional models, validation frameworks, and monitoring systems are built and maintained in production.

TCS appeals to me because of its scale, training environment, and exposure to enterprise technology challenges across different clients and domains. I would be excited to bring my technical foundation, curiosity, attention to detail, and willingness to learn to Tata Consultancy Services as an entry-level Data Engineer.

Thank you for your time and consideration.

Sincerely,

Kenny Nguyen
