90meter, Inc.

Dear Hiring Team,

I am writing to apply for the Entry-Level Software Engineer position at 90meter. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it offers the chance to grow into a specialized systems software role involving secure authentication, cross-platform development, automation, and real-world enterprise deployments.

What interests me most about 90meter is the opportunity to work close to the boundary between software, operating systems, and security. Smart-card software, PKI, credential flows, Windows minidrivers, Linux middleware, and build/test automation are not areas most entry-level engineers get to learn deeply. I'm drawn to roles where I can build a strong technical foundation, work closely with senior engineers, and develop expertise in systems that require careful debugging, reliability, and attention to detail.

My background includes software development across C, C++, C#, Python, JavaScript/TypeScript, SQL, and full-stack web technologies. In my project work, I built MemLock, a Python CLI static analyzer for C code using Tree-sitter to detect vulnerability patterns such as buffer overflows, use-after-free, format string issues, hardcoded secrets, null pointer risks, and unsafe standard library usage. That project strengthened my interest in lower-level software, security, code analysis, and understanding how systems can fail in subtle ways.

I have also built full-stack and automation-focused projects that required debugging across different layers of a system. Backlog, my job search platform, uses Next.js, TypeScript, Supabase/PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel to ingest data, normalize job descriptions, track application state, and support workflow automation. Syllabify, my academic planning application, involved backend APIs, database persistence, authentication, calendar integration, and scheduling logic. Professionally, at EpiBuild, I built internal tools for clinical data collection, extraction, normalization, and billing workflow support, including automation around messy spreadsheet-based records.

While I have not yet worked directly with smart-card minidrivers, PKCS#11, or enterprise certificate systems, I am genuinely interested in learning that domain. I'm comfortable working across Windows and Linux environments, writing scripts and automation, debugging unfamiliar systems, and building up specialized knowledge through hands-on work. I also value mentorship and would be excited by the chance to work side-by-side with senior engineers on secure credential systems used in real deployments.

I would be excited to bring my software engineering foundation, curiosity, debugging mindset, and willingness to learn to 90meter's engineering team.

Thanks for your time,

Kenny Nguyen
