VowchedMe

Dear VowchedMe Team,

I came across the Entry-Level Software Engineer role on Handshake, and this one immediately stood out to me because the stack and product environment feel very close to how I already like to build. React, TypeScript, Supabase, modern web tooling, third-party integrations, and a small team shipping quickly are exactly the kinds of things I've been spending my time on.

What caught my attention most is that VowchedMe is trying to make credibility feel more real than a resume. I'm currently applying for new grad software roles myself, so the idea of turning real endorsements from past collaborators into something measurable honestly makes a lot of sense to me.

On the technical side, I've been building full-stack products that overlap strongly with what you're looking for. My main project, Backlog, is a Next.js/TypeScript job search platform using Supabase for the database and realtime data layer, with AI-based role scoring, resume tailoring, and application workflow tooling. I've also worked with modern frontend patterns, Tailwind, API integrations, authentication flows, and deployment on Vercel. In another project, Syllabify, I built a full-stack academic planning app with React, backend APIs, database persistence, OAuth, calendar integrations, and scheduling logic.

I also have experience with the kind of messy product work that happens outside of perfectly scoped tickets: debugging production issues, integrating third-party services, improving UX, and figuring out how pieces of a system should fit together. At Emerald Media Group, I maintained high-traffic WordPress sites and worked with analytics, ad serving, and third-party integrations. At EpiBuild, I automated clinical data processing and built patient-matching logic to handle inconsistent real-world records.

What I like about this role is that it sounds like I would not just be handed isolated tasks, but would get to build features, fix bugs, ask questions, and contribute to product decisions alongside the founder and design. That is the kind of environment I'm looking for early in my career. I learn quickly, I care about clean and maintainable code, and I like shipping things that people can actually use.

Thanks for your time,

Kenny Nguyen
