Articulate Inc. / ZenHome

Dear Hiring Team,

I am writing to apply for the Forward Deployed Engineer position with Articulate and ZenHome. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it combines product engineering, user-facing problem solving, database-backed systems, integrations, and fast iteration with people actually using the software in the field.

What interests me most about ZenHome is the practical nature of the product. ZenLink appears to solve real operational problems for home service owner-operators: customer communication, paperwork, estimates, job coordination, and the messy workflows that often keep skilled service professionals from focusing on the work itself. I'm drawn to software that is close to the user, where a small change to a workflow, form, database model, automation, or interface can immediately remove friction for someone doing real work.

My background includes full-stack development, backend APIs, database-backed applications, automation, workflow tools, and user-facing web systems. In my project work, I built Backlog, a full-stack job search platform using Next.js, TypeScript, Supabase/PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel. The platform ingests job postings, filters noisy data, normalizes descriptions, tracks application status, and supports workflow automation. Building it required thinking through the full product loop: data intake, user actions, database design, AI-assisted features, UI clarity, and fast iteration based on what would actually make the workflow easier.

I also built Syllabify, an academic planning application that parses unstructured syllabi into structured assignments and generates schedules around user preferences and calendar constraints. That project involved backend APIs, database persistence, authentication, Google Calendar integration, AI-assisted extraction, and translating messy real-world documents into usable product behavior. Professionally, at EpiBuild, I built internal tools for clinical data collection, extraction, normalization, and billing workflow support, which required understanding non-technical user needs and turning operational pain points into practical software.

The forward-deployed nature of this role is especially appealing to me. I like working close to

users, asking what is actually slowing them down, building the smallest useful improvement, and then refining it quickly. I'm comfortable moving across the web app, database, integrations, automation, and product details needed to ship working software. I also value environments with fast feedback loops, where code and design decisions can land in production quickly and be judged by whether they help users.

I would be excited to bring my full-stack foundation, product mindset, attention to detail, and willingness to learn directly from field users to ZenHome's team. Thank you for your time and consideration.

Sincerely,

Kenny Nguyen
