AltitudeIQ, Inc.

Dear AltitudeIQ, Inc. Team,

I came across the Founding Backend Engineer role, and it immediately stood out because it sounds like the opposite of the usual entry-level engineering job. Instead of being handed narrow tickets and slowly learning by accident, this role seems built around accelerated ownership: learning directly from founders, working on hard backend and AI systems, and being expected to grow into someone who can reason clearly about architecture, product, security, and execution.

That is exactly the kind of environment I'm looking for.

I recently completed my B.S. in Computer Science at the University of Oregon, and I've spent the last year building full-stack and AI-integrated systems that forced me to think beyond isolated features. My main project, Backlog, is a full-stack job search platform built with Next.js, TypeScript, Supabase, PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel. It polls job sources, normalizes messy job data, scores fit with AI, generates tailored resume versions, and includes a Chrome extension for application autofill. The hard part was not one individual feature; it was designing the system so data ingestion, AI scoring, caching, user workflows, and browser automation could all fit together cleanly.

I've also built projects closer to backend and systems work. MemLock is a Python CLI static analyzer for C code that uses Tree-sitter to detect vulnerabilities like buffer overflows, use-after-free, format string injection, and hardcoded secrets. Syllabify is a full-stack scheduling app that parses syllabi, extracts assignments, and builds conflict-aware study plans around calendar constraints. I'm also building Bobby, a personal AI voice assistant with local wake word detection, speech-to-text, persistent memory, FastAPI/WebSockets, SQLite, and tool-like PC control.

What excites me about AltitudeIQ is the combination of real enterprise complexity and frontier AI agent work. Sandboxed execution, multi-tenant isolation, human-in-the-loop orchestration, observability, compliance, and agents that actually perform work inside live systems are exactly the kinds of problems I want to grow into. I do not currently know SAP or ABAP, but I am comfortable entering unfamiliar technical areas, building the mental model quickly, and doing

the work to become useful.

I'm also drawn to the apprenticeship aspect of the role. I want to become a much stronger backend and systems engineer, and I care a lot about learning the judgment behind good engineering decisions: how to design systems that are secure, maintainable, observable, and useful to the business. I'm early in my career, but I build independently, ask good questions, communicate clearly, and take ownership seriously.

I'd be excited for the chance to learn from the AltitudeIQ team and contribute to building AI agents that solve real enterprise problems.

Thanks for your time,

Kenny Nguyen
