Promethium

Hi Promethium Team!

I'm excited to apply for the Full Stack Engineer role at Promethium. Your focus on building AI-driven data products and empowering engineers to own features end-to-end strongly resonates with how I like to build: fast and iterative.

Recently, I worked on a team project called Syllabify, a web application that parses course syllabi and automatically generates personalized study schedules. I led development on the parsing and scheduling pipeline, where I tackled one of the core challenges: extracting structured data from highly inconsistent syllabus formats. Because no two syllabi follow the same structure, I designed a hybrid approach using regex-based parsing combined with rule-based heuristics to infer timelines, topics, and workload expectations. This pushed me to think beyond "happy path" engineering and build systems that are resilient to messy real-world inputs.

To complement this, we integrated GPT-based analysis to estimate study load and adapt schedules based on course difficulty and user availability. This experience gave me hands-on exposure to working with LLM APIs, prompt iteration, and building workflows where AI meaningfully augments product functionality, not just as a feature, but as a core part of the system.

Across my projects, I've worked full-stack using React and modern JavaScript frameworks on the front end, along with Python and Node.js on the back end to build APIs and data pipelines. I'm comfortable owning features end-to-end, from designing the UI to implementing backend logic and iterating based on real usage.

What excites me most about Promethium is your emphasis on shipping quickly, experimenting with AI-driven workflows, and giving engineers ownership early. I thrive in environments where I can contribute ideas, move fast, and continuously learn by building.

I'd love the opportunity to contribute to your team and help shape the future of AI-powered data interaction.

Best regards,

Kenny Nguyen
