Cognizant

Dear Hiring Team,

I am writing to apply for the Full Stack Software Developer position at Cognizant. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it offers the opportunity to grow as a full-stack engineer while contributing to real client-facing software in a collaborative, mentored environment.

My background includes full-stack development, backend APIs, database-backed applications, testing, debugging, and modern frontend development. I have experience with JavaScript, TypeScript, React, SQL, REST APIs, Git workflows, Docker, and CI/CD concepts, and I have been continuing to strengthen my backend experience with Java, Spring-style architecture, C#, and .NET. I'm especially interested in roles where I can work across the stack, understand the business problem, and help build reliable applications that are maintainable for real teams.

In my project work, I built Backlog, a full-stack job search platform using Next.js, TypeScript, Supabase/PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel. The platform ingests job postings, filters noisy data, normalizes descriptions with AI, scores role fit, tracks application status, and supports application workflow automation. Building it required designing the data model, connecting frontend workflows to backend state, integrating APIs, debugging edge cases, and thinking carefully about performance, usability, and maintainability.

I also built Syllabify, an academic planning application that parses unstructured syllabi into structured assignments and generates schedules around calendar constraints. That project involved React, backend APIs, database persistence, authentication, calendar integration, team collaboration, Agile-style planning, and stakeholder updates. Professionally, I worked as a Software Engineer Intern at EpiBuild, where I developed internal tools for clinical data collection, extraction, normalization, and billing workflow support, and as a Web Developer at Emerald Media Group, where I maintained production websites and resolved issues involving third-party integrations.

What interests me about Cognizant is the chance to work with experienced engineers on scalable web applications, reactive services, testing, documentation, and client-focused technology

solutions. I also appreciate the emphasis on continuous learning and AI-powered tools. I use tools like Claude, ChatGPT, Codex, Gemini, and Cursor regularly in my development workflow, but I treat generated code like a pull request: I review the logic, test the behavior, check edge cases, and make sure I understand what is being shipped.

I am legally authorized to work in the United States and do not require sponsorship. I would be excited to bring my full-stack foundation, problem-solving mindset, and willingness to learn to Cognizant's engineering teams.

Thanks for your time,

Kenny Nguyen
