Pacific States Marine Fisheries Commission

Dear Hiring Team,

I am writing to apply for the Full Stack Software Engineer, Fish Data Systems position with Pacific States Marine Fisheries Commission. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it combines full-stack software engineering, data systems, public-service impact, and work that directly supports sustainable fisheries management across the Pacific region.

My background includes full-stack development, backend APIs, database-backed applications, data processing, automation, testing, and production web systems. I have experience with JavaScript, TypeScript, React, Python, SQL, REST APIs, Git workflows, relational databases, and building tools around real operational workflows. I enjoy working on software where accuracy, reliability, maintainability, and clear communication matter because the systems support decisions beyond the codebase itself.

Professionally, I worked as a Software Engineer Intern at EpiBuild, where I built internal tools for clinical data collection, extraction, normalization, and billing workflow support. That work required taking messy real-world data, improving consistency, automating repetitive processes, and developing patient-matching logic using Levenshtein distance to identify inconsistent names, duplicate records, and missing identifiers. While the domain was healthcare, the core problem was similar to many public data systems: transforming inconsistent data into something reliable enough for people to use and trust.

My project work has also strengthened my full-stack and data-system skills. In Backlog, I built a full-stack job search platform using Next.js, TypeScript, Supabase/PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel. The system ingests data from multiple sources, filters noisy records, normalizes descriptions, tracks application state, and supports user workflows through a relational database-backed application. In Syllabify, I helped build an academic planning application that parses unstructured syllabi into structured assignments and generates schedules around calendar constraints, requiring backend APIs, database persistence, authentication, and team-based development.

What interests me about PSMFC is the opportunity to build and maintain systems that support fisheries management, population rebuilding, mitigation, harvest allocation, and collaboration across Tribal, Federal, State, and non-governmental partners. I'm based in Oregon and would be excited to contribute to software that supports Pacific Northwest communities, natural resources, and long-term environmental stewardship.

I would be excited to bring my full-stack engineering foundation, data workflow experience, attention to detail, and willingness to learn to Pacific States Marine Fisheries Commission. Thank you for your time and consideration.

Sincerely,

Kenny Nguyen
