Be All You / Trailblazer

Dear Be All You / Trailblazer Team,

I came across the Full-Stack Engineer role for Trailblazer, and it immediately stood out to me because it connects several things I care about: education, career development, AI-assisted systems, and building real products from messy early-stage ideas.

I recently completed my B.S. in Computer Science at the University of Oregon, and a lot of my strongest work has been around full-stack products that turn unstructured information into something usable. My capstone project, Syllabify, was an academic planning platform that parsed syllabi, extracted assignments and deadlines, and generated conflict-aware study schedules around student preferences and calendar data. That project made me think a lot about how students actually make decisions when they are overwhelmed by information — and how software can structure that information into something actionable.

I've also been building Backlog, a full-stack job search platform that aggregates new grad roles, filters noisy job data, scores role fit with AI, and helps organize the application workflow. It started from my own frustration with job searching, but became a larger system involving data ingestion, normalization, recommendation-like scoring, workflow tracking, and AI-assisted content generation. That experience feels especially relevant to Trailblazer because the hard part is not just building a nice UI; it is designing the underlying system so students, mentors, stories, recommendations, and generated content all connect cleanly.

What I like about this role is that you are not describing a surface-level frontend project. You are describing architecture, data models, backend reliability, AI workflows, and product decisions with real users. That is the kind of work I want to be close to. I enjoy taking early, ambiguous ideas and turning them into structured systems: defining the data model, building the API layer, improving the frontend experience, integrating AI where it actually helps, and making the product more reliable over time.

I'm comfortable working across React, Next.js-style frontend development, backend APIs, databases, structured data, and AI-assisted workflows. I also care about the product side: what users are trying to do, where they get confused, what data should be captured, and how the

system should evolve as usage grows.

I'd be excited to help refactor and stabilize Trailblazer, improve the student and storyteller data model, and build toward a platform that can support real usage at scale.

Thanks for your time,

Kenny Nguyen
