State of Michigan

Department of Technology, Management, and Budget

Dear Hiring Team,

I am writing to apply for the ITPA 11 - Application Developer position with the State of Michigan Department of Technology, Management, and Budget. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and I am interested in contributing to public-sector software systems that support important agency operations and services.

What stood out to me about this role is the opportunity to work across the full software development lifecycle: designing, developing, testing, implementing, maintaining, and improving applications used by state agencies. My background includes full-stack application development, backend APIs, databases, debugging, testing, documentation, and collaboration with both technical and non-technical stakeholders. I enjoy understanding user needs, translating requirements into working software, and improving systems so they are easier to maintain over time.

In my recent project work, I built Syllabify, a full-stack academic planning application that parses syllabi, extracts assignments and due dates, and generates conflict-aware study schedules around student preferences and calendar data. The project involved React, backend REST APIs, database persistence, authentication, Google Calendar integration, Docker, Git workflows, and CI practices. I also built Backlog, a full-stack job search platform that aggregates job postings, normalizes messy data, scores role fit with AI, and tracks application workflows. These projects strengthened my ability to design data models, build reliable application logic, debug across the stack, and think carefully about usability and maintainability.

Professionally, I worked as a Software Engineer Intern at EpiBuild, where I automated clinical data processing and developed patient-matching logic to address inconsistent spreadsheet records. I also worked as a Web Developer at Emerald Media Group, where I maintained high-traffic production websites, diagnosed issues involving third-party integrations, and collaborated with editorial and business teams to ship practical web features.

I am especially interested in this position because DTMB supports systems that directly affect state agency operations, including DHHS Children's Services and State Hospitals. I understand that applications in this environment require attention to detail, clear documentation, reliability, and alignment with IT best practices. I would be excited to bring my software engineering foundation, problem-solving mindset, and willingness to learn to the Agency Services team.

Thank you for your time and consideration. I would welcome the opportunity to discuss how my background in application development, data workflows, and full-stack systems could support DTMB's work.

Thanks for your time,

Kenny Nguyen
