Neptune North / University of Illinois Research Park and EnterpriseWorks

Dear Hiring Team,

I am writing to apply for the Java Developer role with Neptune North. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and I'm interested in the opportunity to work on high-quality software systems in a fast-paced environment where engineering, communication, and business understanding all matter.

What stood out to me about this role is the emphasis on owning problems end-to-end: understanding business requirements, developing the solution, testing it carefully, supporting users, and improving the system over time. That is the kind of engineering work I enjoy most. I like building software that is not just technically correct, but useful to the people relying on it.

My background includes full-stack development, backend APIs, databases, testing, debugging, and collaborative engineering workflows. I have experience with Java, Python, JavaScript, TypeScript, React, REST APIs, SQL databases, Git, Docker, and CI practices. In my project work, I built Syllabify, a full-stack academic planning application that parses syllabi, extracts assignments and deadlines, and generates conflict-aware schedules using backend logic, database persistence, authentication, and calendar integrations. I also built Backlog, a full-stack job search platform that aggregates job postings, normalizes messy data, scores role fit with AI, tracks application workflows, and supports resume tailoring.

Professionally, I worked as a Software Engineer Intern at EpiBuild, where I automated clinical data processing and built patient-matching logic to address inconsistent spreadsheet records. I also worked as a Web Developer at Emerald Media Group, where I maintained production websites, diagnosed issues involving third-party integrations, and collaborated with editorial and business stakeholders to deliver usable features. These experiences helped me become comfortable working with ambiguous requirements, debugging across systems, and communicating clearly with non-engineering users.

I am especially interested in Neptune North because of the combination of engineering rigor, direct collaboration with business users, and exposure to financial systems. While I have not worked with Calypso specifically, I am very interested in learning financial instrument

processing and understanding the user workflows behind the software. I enjoy domains where the details matter, the systems are complex, and strong communication is just as important as writing code.

I would be excited to bring my CS foundation, problem-solving ability, and willingness to learn to Neptune North as a Java Developer. Thank you for your time and consideration.

Thanks for your time,

Kenny Nguyen
