1Phi

Dear Hiring Team,

I am writing to apply for the New Grad Data Engineer role at 1Phi. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and I'm excited by the opportunity to work on healthcare data systems that can make preventive care, treatment access, and patient decision-making more understandable and accessible.

What stood out to me about 1Phi is the combination of data engineering, healthcare domain complexity, and real product impact. The role's focus on Medicare claims data, SQL-heavy transformations, validation checks, data quality, and downstream analytics feels like the kind of work where careful engineering directly affects the usefulness and trustworthiness of the product. I'm especially interested in systems where correctness matters, the data is messy, and the end goal is helping people make better decisions.

My most relevant professional experience is from my Software Engineer Internship at EpiBuild, where I automated clinical data processing using Google Apps Script and worked with spreadsheet-based healthcare records. I extracted and normalized chart data, then developed patient-matching logic using Levenshtein distance to resolve inconsistent name spellings and missing identifiers. That experience taught me how important data quality is in healthcare-adjacent workflows, especially when small inconsistencies can create downstream confusion.

My project work has also involved building data-driven systems end-to-end. In Backlog, I built a full-stack job search platform that ingests roles from multiple sources, filters noisy data, normalizes job descriptions with AI, scores role fit, and tracks application workflows. In Syllabify, I helped build an academic planning application that parses unstructured syllabi into structured assignments and generates schedules around user constraints and calendar data. Both projects required thinking carefully about data ingestion, schema design, transformation logic, validation, and how clean outputs support useful product features.

I'm comfortable with Python, SQL, backend APIs, relational databases, Git workflows, and learning unfamiliar technical domains quickly. While I have not worked professionally with

Medicare claims data or Databricks yet, I'm excited to ramp up on CMS data structures, Spark-based processing, healthcare coding systems, and the validation practices needed for large-scale healthcare analytics.

I would be excited to bring my software engineering foundation, healthcare-adjacent data experience, attention to detail, and curiosity to 1Phi's team. Thank you for your time and consideration.

Thanks for your time,

Kenny Nguyen
