Nebraska Public Power District

Dear Hiring Team,

I am writing to apply for the Operations Technology Cyber Security Technical, Systems, or Senior Systems Analyst position with Nebraska Public Power District. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it combines cybersecurity, technical systems support, process documentation, compliance workflows, and public-service infrastructure in the energy industry.

My background includes software development, IT support, data processing, automation, documentation, and troubleshooting across user-facing and technical systems. I am especially interested in roles where technical work supports reliability, security, and operational continuity. NPPD's mission is compelling to me because the work directly supports communities, critical infrastructure, and the safe delivery of reliable power.

Professionally, I worked as a Software Engineer Intern at EpiBuild, where I built internal tools to support clinical data collection, extraction, normalization, and billing workflows. That work required translating messy operational processes into clearer technical workflows, improving data consistency, documenting logic, and building automation around real business needs. I also worked as a Web Developer at Emerald Media Group, where I maintained production websites, resolved issues involving third-party integrations, and collaborated with non-technical stakeholders to support reliable systems.

Earlier in my career, I worked as a Computer Helpdesk Technician at Pacific University, where I supported Windows and macOS workstations, software installation, OS configuration, account support, peripherals, printers, cabling, hardware diagnostics, and end-user troubleshooting. That experience helped me develop a customer-service mindset, patience with technical support work, and an appreciation for documentation, communication, and dependable systems.

My project work also reflects my interest in security and structured technical problem solving. I built MemLock, a static analysis CLI for C code using Python and Tree-sitter, to detect vulnerability patterns such as buffer overflows, use-after-free risks, format string issues, hardcoded secrets, null pointer risks, and unsafe standard library usage. While it was a personal

project, it strengthened my interest in software security, risk identification, and careful review of technical systems.

What interests me about this NPPD role is the opportunity to grow across OT cybersecurity, compliance, process improvement, and systems analysis. While I do not yet have direct professional experience with NERC CIP standards or utility operations technology, I am motivated to learn the domain and would bring a strong foundation in technical troubleshooting, documentation, software systems, analytical problem solving, and cross-functional collaboration.

I would be excited to contribute to NPPD's OT Cyber Security & CIP Operations team and support work that strengthens both compliance and security for critical infrastructure. Thank you for your time and consideration.

Sincerely,

Kenny Nguyen
