Ultraviolet

Dear Hiring Team,

I am writing to apply for the React Native Software Engineer position at Ultraviolet. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it is exactly the kind of early-career engineering environment I am looking for: small team, real production software, direct ownership, mentorship, and fast iteration.

My background includes full-stack development, frontend engineering, mobile app development, testing, debugging, and AI-assisted development workflows. I have experience with JavaScript, TypeScript, React, Next.js, Tailwind CSS, REST APIs, SQL, Git, and building user-facing applications. While my strongest production-style project experience has been in web applications, I am especially interested in growing further in React Native and mobile product development.

One project that connects closely with this role is Shuckler, a mobile music app I built using Kotlin, Jetpack Compose, and ExoPlayer. Building it gave me hands-on experience thinking through mobile UI, playback controls, app state, native user interactions, and the difference between a web interface and a mobile experience. I have also built full-stack projects like Backlog, a job search and application workflow platform using Next.js, TypeScript, Supabase/PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel. That project required building product flows, debugging issues across the stack, and improving the user experience around messy real-world workflows.

I use AI-assisted development tools regularly, including Claude Code, ChatGPT, Codex, Gemini, and Cursor. I use them to speed up implementation, explore options, debug problems, and review code, but I do not treat AI output as automatically correct. I review diffs, test behavior, check edge cases, and make sure I understand the implementation before accepting or shipping anything. That mindset feels especially important in a startup environment where speed matters, but reliability and product quality still matter too.

What interests me about Ultraviolet is the chance to contribute meaningfully as a junior engineer

instead of being limited to tiny isolated tasks. I'm comfortable learning quickly, asking good questions, communicating progress clearly, and jumping into whatever part of the product needs help. I would be excited to bring my React/TypeScript foundation, mobile development interest, AI-assisted workflow, and willingness to learn to Ultraviolet's engineering team.

Thank you for your time and consideration.

Sincerely,

Kenny Nguyen
