Etegent Technologies

Dear Hiring Team,

I am writing to apply for the Software Engineer position at Etegent Technologies. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it combines several areas I'm excited to grow in: software engineering, data analytics, AI/ML-enabled tools, visualization, deployment, and building practical systems for users working on complex technical problems.

What interested me most about Etegent is the focus on transitioning data exploitation algorithms from R&D into usable software for DoD and Intelligence Community customers. I like the idea of working at the boundary between research and production: taking algorithms, data workflows, and technical ideas, then turning them into software that is reliable, understandable, and useful to real users. That kind of work requires curiosity, careful engineering, collaboration, and the ability to learn unfamiliar domains quickly, which are all things I've been intentionally building.

My background includes full-stack development, backend APIs, databases, data processing, automation, testing, and AI-assisted workflows. In my Software Engineer Internship at EpiBuild, I automated clinical data processing and built patient-matching logic using Levenshtein distance to resolve inconsistent names and missing identifiers across spreadsheet-based records. That experience gave me practice working with messy real-world data, validation logic, and software tools that improve operational workflows.

My project work also connects with several parts of this role. Backlog, my full-stack job search platform, uses Next.js, TypeScript, Supabase/PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel to ingest noisy job data, normalize descriptions, score role fit with AI, and support application workflows. Syllabify, my academic planning platform, parses unstructured syllabi into structured assignments and generates schedules around calendar constraints. I also built MemLock, a Python CLI static analyzer for C code using Tree-sitter to identify vulnerability patterns such as buffer overflows, use-after-free, hardcoded secrets, and unsafe standard library calls. These projects strengthened my experience with Python, SQL, React/TypeScript, API design, structured data, testing, and building tools that turn complex inputs into usable outputs.

I am especially interested in Etegent's work involving machine learning pipelines, scientific data visualization, webstack development, databases, infrastructure, and deployment. While I am early in my career, I'm comfortable learning new technical areas quickly and working across different parts of a system. I also understand the importance of writing modular, documented, testable code and communicating progress clearly, especially in environments where software supports mission-focused users.

I am a U.S. citizen and am able to obtain and maintain a security clearance. I would be excited for the opportunity to bring my software engineering foundation, curiosity, adaptability, and willingness to learn to Etegent's team.

Thank you for your time and consideration.

Thanks for your time,

Kenny Nguyen
