HOJ Innovations / WarehouseOS

Dear Hiring Team,

I am writing to apply for the Software Engineer position on the WarehouseOS team at HOJ Innovations. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it combines software engineering, SaaS product development, customer-focused problem solving, and practical systems that support warehouse and logistics operations.

My background includes full-stack development, backend APIs, database-backed applications, automation, testing, and production web systems. I have experience with JavaScript, TypeScript, React, SQL, REST APIs, Git workflows, and object-oriented programming, and I have been continuing to build experience with C#/.NET-style application development. I enjoy working on products where the software is tied to real operational workflows, especially when reliability, usability, and maintainability matter.

In my project work, I built Backlog, a full-stack job search platform using Next.js, TypeScript, Supabase/PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel. The project required designing database-backed workflows, building responsive user interfaces, integrating APIs, managing application state, and thinking through how users move through a product from discovery to action. I also built Syllabify, an academic planning application involving backend APIs, database persistence, authentication, calendar integration, and scheduling logic.

Professionally, I worked as a Software Engineer Intern at EpiBuild, where I built internal tools for clinical data collection, extraction, normalization, and billing workflow support. That work involved understanding messy real-world processes, automating repetitive tasks, improving data consistency, and iterating based on user feedback. I also worked as a Web Developer at Emerald Media Group, where I maintained production websites, resolved issues involving third-party integrations, and collaborated with editorial and business teams to support reliable user-facing systems.

What interests me about HOJ is the chance to work on software that supports real warehouse, material handling, and logistics workflows. I like the idea of contributing to a SaaS product

where engineering decisions affect how teams organize inventory, operations, and customer solutions. I'm also drawn to the team-oriented culture and the opportunity to work across the software lifecycle: implementing features, writing tests, participating in design sessions, debugging beta issues, and collaborating with different departments.

I would be excited to bring my software engineering foundation, attention to detail, communication skills, and willingness to learn to HOJ Innovations and the WarehouseOS team. Thank you for your time and consideration.

Sincerely,

Kenny Nguyen
