Walt Disney

Dear Hiring Team,

I'm very excited to apply for the Software Engineer I position with Disney Entertainment & ESPN Product & Technology. The opportunity to build systems that power the metadata and user experience behind platforms like Disney+ and ESPN+ immediately stood out to me, as it sits at the intersection of scalability, data modeling, and user-facing impact.

In my recent project, Syllabify, I worked on a team to build a web application that parses course syllabi and generates personalized study schedules. One of the most challenging aspects was designing a flexible parsing system to handle highly inconsistent input formats. I developed a rule-based and regex-driven pipeline to extract structured data from unstructured documents, which required balancing robustness with adaptability. This experience gave me a strong appreciation for the complexity of ingesting, normalizing, and managing metadata at scale, which is something that directly aligns with the work your team is doing for Disney's streaming platforms.

Beyond parsing, I've built full-stack applications using JavaScript and Python, working with RESTful APIs, databases, and modern development tools. I'm comfortable collaborating in team environments, participating in code reviews, and quickly learning new technologies when needed. I also enjoy thinking through system design trade-offs, especially when it comes to performance, scalability, and maintainability.

What excites me most about this role is the impact: building systems that help deliver content from Disney, Pixar, Marvel, and more to millions of users worldwide. I'm particularly drawn to your team's focus on innovation, distributed systems, and the engineering culture that encourages continuous learning and ownership.

I would love the opportunity to contribute to your team and continue growing as an engineer while helping build the future of Disney's streaming experience.

Thank you for your time and consideration.

Best regards,

Kenny Nguyen
