Delsys, Inc.

Dear Hiring Team,

I am writing to apply for the Software Engineer - Backend position at Delsys. I recently completed my Bachelor of Science in Computer Science at the University of Oregon, and this role stood out to me because it combines backend software engineering, product infrastructure, data management, and real-world health technology. I'm especially interested in software that connects technical systems to practical applications in healthcare, research, and human performance.

My background includes backend APIs, database-backed applications, automation, data processing, testing, and full-stack product development. I have experience with Python, Java, C#, C++, JavaScript/TypeScript, SQL, REST APIs, relational databases, Git workflows, and object-oriented programming. I enjoy working on systems where reliability, clean architecture, and maintainable backend logic matter.

Professionally, I worked as a Software Engineer Intern at EpiBuild, where I built internal tools for clinical data collection, extraction, normalization, and billing workflow support. That work required understanding messy healthcare-related data, improving consistency, automating repetitive processes, and building tools around real operational needs. I also developed patient-matching logic using Levenshtein distance to identify inconsistent name spellings, duplicate records, and missing identifiers across spreadsheet-based data. That experience made me more interested in software that supports health-related workflows and accurate data handling.

My project work has also strengthened my backend and product engineering skills. In Backlog, I built a full-stack job search platform using Next.js, TypeScript, Supabase/PostgreSQL, OpenAI/Claude APIs, Playwright, and Vercel. The platform ingests data from multiple sources, normalizes job descriptions, scores role fit, tracks application state, and supports workflow automation through a database-backed system. In Syllabify, I helped build an academic planning application involving backend APIs, database persistence, authentication, calendar integration, and scheduling logic.

What interests me about Delsys is the opportunity to contribute to backend infrastructure behind physiological measurement devices and signal acquisition software. While I have not yet worked professionally with wearable sensors, device drivers, or real-time signal acquisition systems, I am excited by the chance to learn that domain and apply my backend, data, and software engineering foundation to products with real-world health impact. I'm especially drawn to the idea of translating research and measurement systems into production-ready software that people can actually use.

I would be excited to bring my backend development foundation, healthcare-adjacent data experience, debugging mindset, and willingness to learn to Delsys' Product Development Team. Thank you for your time and consideration.

Thank you for your time and consideration.

Sincerely,

Kenny Nguyen
