Software Engineer Mid

Dear Reliant Technologies Team,

I came across the Software Engineer Mid role at Reliant Technologies and was interested in the opportunity to support software development for the Joint Training Synthetic Environment. The role stood out to me because it combines several areas I care about: building reliable software systems, working from requirements, debugging complex behavior, and contributing to tools that support real-world training and simulation needs.

I recently completed my B.S. in Computer Science at the University of Oregon, and my background includes full-stack development, backend systems, automation, testing, and production support. I've worked with languages including Python, JavaScript, C, C++, Java, and C#, and I'm comfortable learning across different environments depending on what the system requires. I also have experience with Git-based workflows, technical documentation, debugging, and building software with maintainability in mind.

In my project work, I've built systems that required more than just frontend polish. Syllabify, my academic planning platform, used React, backend APIs, database persistence, authentication, calendar integrations, and scheduling logic to turn unstructured syllabus data into usable study plans. Backlog, my full-stack job search platform, required data ingestion, filtering, AI-assisted normalization, application state tracking, and browser automation. I also built MemLock, a Python static analysis CLI for C code that uses Tree-sitter to detect issues such as buffer overflows, use-after-free patterns, format string vulnerabilities, and unsafe standard library calls.

Professionally, I worked as a Software Engineer Intern at EpiBuild, where I automated clinical data processing and built patient-matching logic to resolve inconsistent records. I also worked as a Web Developer at Emerald Media Group, where I maintained high-traffic production websites, diagnosed issues involving third-party integrations, and collaborated with editorial and business teams to ship usable web features.

What interests me about Reliant Technologies is the chance to contribute to software where correctness, documentation, testing, and clear requirements matter. I enjoy working through ambiguous technical problems, understanding how systems fit together, and writing code that

other engineers can maintain. I'm also comfortable using AI code generation tools as part of my workflow, but I treat generated code like a pull request: I review the diff, test the behavior, and make sure I understand what is being shipped.

I'd be excited for the opportunity to bring my software engineering foundation, debugging mindset, and willingness to learn to the Reliant Technologies team.

Thanks for your time,

Kenny Nguyen
